

PRINTED CIRCUIT BOARD WHICH CAN BE CONNECTED WITH PIN CONNECTOR
AND METHOD OF MANUFACTURING THE PRINTED CIRCUIT BOARD

ABSTRACT OF THE DISCLOSURE

5 A printed circuit board that can be connected with a pin connector and a method of
manufacturing the printed circuit board are provided. Solidified solder can be formed on the
tap unit without the need for additional processes, by applying solder printing to the tap unit
at the same time it is applied to pads of the printed circuit board and, for example, by
performing high temperature reflow. In addition, reliability and reduction in cost of a pin
10 connector can be ensured without using a pin connector into which a high-priced wired solder
is inserted. Rather a general pin connector can be used because the pin connector and the tap
unit are connected to each other through the solidified solder formed on the tap unit.
